

# Comprehensive Insect Physiology, Biochemistry & Pharmacology : Volume 1

Overall, Volume 1 reflects the realisation that reproductive mechanisms are of fundamental importance in understanding the success of insects as organisms, together with the fact that some insects have provided model systems with which to study important fundamental reproductive processes such as spermatogenesis, mitosis and meiosis. This volume therefore deals with the structure and function of the basic machinery of reproduction: gonads, ducts, gametes, fertilization and early development and sets out what is known (and also what is not known) about these processes. Because of the enormous growth in the recent literature on insect reproduction, each chapter serves as an introduction for a newcomer in the respective research field by providing a complete list of references.

From the dishwasher and microwave oven in the kitchen and the clock radio next to your bed, to the cellular phone you hold to your ear—sometimes for hours each day—exposure to EMR is growing and becoming a serious health threat. Read more... Genetics of Cancer Author: Dr. Magdy Aly Genetics of Cancer Genes are the heart and brain of our development. They dictate the color of our eyes, our complexion and most certainly our susceptibility to develop certain illnesses, among which, Cancer is one that we are most concerned about. Is there a way to determine if we are predisposed and carry a higher risk of developing certain cancers? Can we predict at what age we may develop an illness? And if so, what can, or rather, shall we do about it. Read more...
