

# Response of Fodder Pearl millet to Different Levels of Nitrogen: Under Irrigated Condition of North-Western Rajasthan

India is known for harbouring 15% livestock population of the world. The efficiency of milch and draught animals depend upon on the quantity and quality of ration in which green fodder plays a vital role there is a wide gap between demand and supply of green fodder. Due to the increasing pressure of human population on land in the country, top priority is given to foodgrains. Pearl millet is the most suitable fodder crop for the arid and semiarid zones of Rajasthan state of India owing to its drought resistant, fast growing, high yielding and highly nutritious nature. Nitrogen is the basic plant nutrients essential for vegetative growth, chlorophyll and various physiological process of the plant. Keeping the above facts in view, the present study was aimed to discover the best pearl millet hybrids/synthetics/composites and optimum dose of nitrogen for increasing the fodder quantity and quality in North-Western Rajasthan

From the dishwasher and microwave oven in the kitchen and the clock radio next to your bed, to the cellular phone you hold to your ear—sometimes for hours each day—exposure to EMR is growing and becoming a serious health threat. Read more... Genetics of Cancer Author: Dr. Magdy Aly Genetics of Cancer Genes are the heart and brain of our development. They dictate the color of our eyes, our complexion and most certainly our susceptibility to develop certain illnesses, among which, Cancer is one that we are most concerned about. Is there a way to determine if we are predisposed and carry a higher risk of developing certain cancers? Can we predict at what age we may develop an illness? And if so, what can, or rather, shall we do about it. Read more...
