

Synthesis and Biological Evaluation of Cu, Ni, Mn and Zn Complexes: Azithromycin

New Schiff base complexes of Copper, Nickel, Manganese and Zinc derived from Azithromycin with salicylaldehyde have been synthesized. Complexes were synthesized and physico-chemically characterized by solubility testing, melting point and FTIR. The synthesized metal complex was evaluated for antibacterial activity against the multidrug resistant pathogens, such as Gram-negative *Escherichia coli* and Gram-positive *Staphylococcus aureus* and antifungal activity in opposition to *Aspergillus niger* and *Aspergillus flavus*. The metal complex showed the significant antibacterial and antifungal activity in comparison with free ligand.

From the dishwasher and microwave oven in the kitchen and the clock radio next to your bed, to the cellular phone you hold to your ear—sometimes for hours each day—exposure to EMR is growing and becoming a serious health threat. Read more... Genetics of Cancer Author: Dr. Magdy Aly Genetics of Cancer Genes are the heart and brain of our development. They dictate the color of our eyes, our complexion and most certainly our susceptibility to develop certain illnesses, among which, Cancer is one that we are most concerned about. Is there a way to determine if we are predisposed and carry a higher risk of developing certain cancers? Can we predict at what age we may develop an illness? And if so, what can, or rather, shall we do about it. Read more...
